IRC 5” & 6” Aluminum Post Mount (Residential)
Installation Instructions

NOTE: These instructions must be followed exactly as written and the material used must be exactly as shown in the instructions. Any deviation from the instructions or variation in the material used/installed may result in an unsuccessful installation.

Concrete Surface Installation:
Place alum post mount so the screw channels will be PERPENDICULAR To the railing. Fasten aluminum post mount to concrete using (4) 3/8” x 3” concrete screws (screws not included).

Level the post mount by adjusting the leveling bolts and anchoring fasteners as necessary. A ½” open end wrench will be needed for leveling bolts. Once post mount is level and anchored securely, slide the vinyl post with flair to the floor.

When the railing system is installed, the lower screws from the external railing mount will go through the vinyl post and into the bottom block. This will secure the vinyl post to the post mount.

Wood Surface Installation:
Place alum post mount so the screw channels will be PERPENDICULAR To the railing. Fasten aluminum post mount to wood surface using (4) ¼” x 4” or longer stainless steel lags (lags not included).

Level the post mount by adjusting the leveling bolts and anchoring fasteners as necessary. A ½” open end wrench will be needed for leveling bolts. Once post mount is level and anchored securely, slide the vinyl post with flair to the floor.

When the railing system is installed, the lower screws from the external railing mount will go through the vinyl post and into the bottom block. This will secure the vinyl post to the post mount.

WARNING: When installing the Aluminum Post Mount on top of a wood structure, the 4” lags MUST be lagged entirely into substrate! It will not be strong enough if it is fastened into a 5/4’ or a 1½” thick deck board!

Below is an example of how to design the wood structure to accept the Aluminum Post Mount. Any other way must meet or exceed these qualifications.
