Aluminum Post Mount

Installation Instructions

• It is the responsibility of the installer to meet all code and safety requirements, and to obtain all required building permits. The installer should determine and implement the installation techniques appropriate for each unique installation situation. Digger Specialties, Inc. and its distributors shall not be held liable for improper or unsafe installations.

<tr>
<td>NOTE: The installer is responsible to have the substructure strong enough to support the post for what it is rated.</td>
<td>1. Stay in from edge of concrete pad the distance required by the local code authority to prevent “blowout” of concrete pad edge.</td>
</tr>
</tbody>
</table>

**IRC Wood Installation**

1. Place the (2) stainless steel shims below the plate under the leveling bolts.

2. **Option 1:** Fasten aluminum post to wood surface using (4) 3/8” x 5” or longer stainless steel lags (lags not included). WARNING: When installing the aluminum post on top of a wood structure, the 5” lags MUST be lagged into at least 4” of solid wood! It will not be strong enough if it is fastened into a 5/4” or a 1½” thick deck board! Below is an example of how to design the wood structure to accept the aluminum post. Any other way must meet or exceed these qualifications.

   - 4” x 4” wood post is flush with top of wood joist.
   - Aluminum post position with 4” x 4” wood support post.
   - Add extra 2” x 6” blocking (if 4” x 4” wood post exists, attach to 4” x 4” wood post). Position aluminum post mount over wood posts. All 4 lags will fasten to a joist or 2” x 6” board.

**Option 2:** Attach wood blocking to substructure with #10 x 3” wood screws. Fasten aluminum post using (4) 3/8”x 5-1/2” bolts (anchors not included) thru aluminum backer plate (sold separately) as shown below.

**Option 3:** Fasten aluminum post to concrete using (4) 3/8” x 3” or longer concrete anchors (anchors not included.)

3. Use a ½” open end wrench to level aluminum post with the leveling bolts on the welded plate.

4. Place cap on top of post, ensuring that it is aligned properly and level before gently tapping with a rubber mallet. (Cap may break if not set on post properly.)

5. Use anchoring cement or epoxy to set post.

6. When core drilling any post product where water can build up, the installer is responsible to drill a ¼” weep hole in post as close to the bottom of the post by concrete as possible. If there is no weep hole, you may have damage from moisture build up and freezing thus potentially voiding the product warranty.

**Note:** For Fascia Mount installation please see HD Fascia Mount Instructions located on the DSI website.
